Important Information for Data Users

Please Review This Section Before Using the Following Public Health Data

What is 3-4-50?

Chronic diseases are now the major cause of death and disability worldwide, having surpassed infectious diseases and injuries. This reflects a significant change in diet habits, physical activity levels, and tobacco use.¹ The 3-4-50 concept² is defined as three behaviors (poor diet, physical inactivity, and tobacco use) which contribute to four chronic diseases (cancer, heart disease and stroke, type 2 diabetes, and pulmonary diseases such as asthma) that cause over 50 percent of all deaths worldwide. These chronic diseases are important to consider together because they are common causes of disability and death in San Diego County. They are also highly influenced by three unhealthy behaviors; behaviors that cause many cases of the specified chronic conditions that are preventable. In San Diego County in 2007, the 3-4-50 diseases, considered together, cost \$4 billion in direct treatment expenditures.³

What is presented in this document?

In this document, death statistics on stroke, coronary heart disease (CHD), diabetes, chronic obstructive pulmonary disease (COPD), asthma, and cancer from 2000- 2010 in San Diego County are presented. County level, Region level, and Subregional Area (SRA) level information are provided. For more information on 3-4-50, visit the County's in depth report [3-4-50: Chronic Disease in San Diego County](#).

Understanding Public Health Data

Within this document, percentages and rates are presented to describe the burden of chronic disease in San Diego County.

- A percentage is a way to express how small or large a quantity is relative to another quantity
- A rate is the number of cases divided by the population, usually multiplied by a constant. For example 987 cases, divided by population of 654,321 would be a rate of 150.8 per 100,000 population. This means for every 100,000 people, 150-151 cases would be expected.

Both measures are provided to give a more balanced look at the burden of chronic disease within the County. Percentages, in this case, allow for the comparison of the number chronic disease deaths relative to the number of deaths overall.

Percentages are influenced by both the number of chronic disease deaths and the number of all cause deaths. It is important to keep this in mind when interpreting the data. For example, two Regions could have the same number of chronic disease deaths, but could have completely different percentages of chronic disease deaths based on the number all cause deaths in each area.

	Region A	Region B
Number of Chronic Disease Deaths	50	50
Number of All Cause Deaths	100	80
Percentage of Deaths Due to Chronic Disease	$(50/100)*100\% = 50\%$	$(50/80)*100\% = 62.5\%$

To further understand the burden of chronic disease in the County, rates were calculated to allow for comparison of between Regions, accounting for the size of the each area's population.
